

I found out I cannot draw text on screen for this assignment, so the button cannot say "on" or "off".

I had some trouble with the boolean I created to remember the state of the mouse button press. Eventually, it worked by initializing it outside of the setup.

I tried using an integer instead of a boolean. I would start it at 1, and add 1 every time the mouse button is pressed over the rectangle. I would check if the integer value was even or odd by checking if the remainder was equal or not equal to zero. This didn't end up working. Nothing would happen upon an input. The rectangle wouldn't even change shade if the cursor was hovering over. I'm not sure why this happened.

I'd still like to make it possible to revert to its initial state, but I need to find a different way.

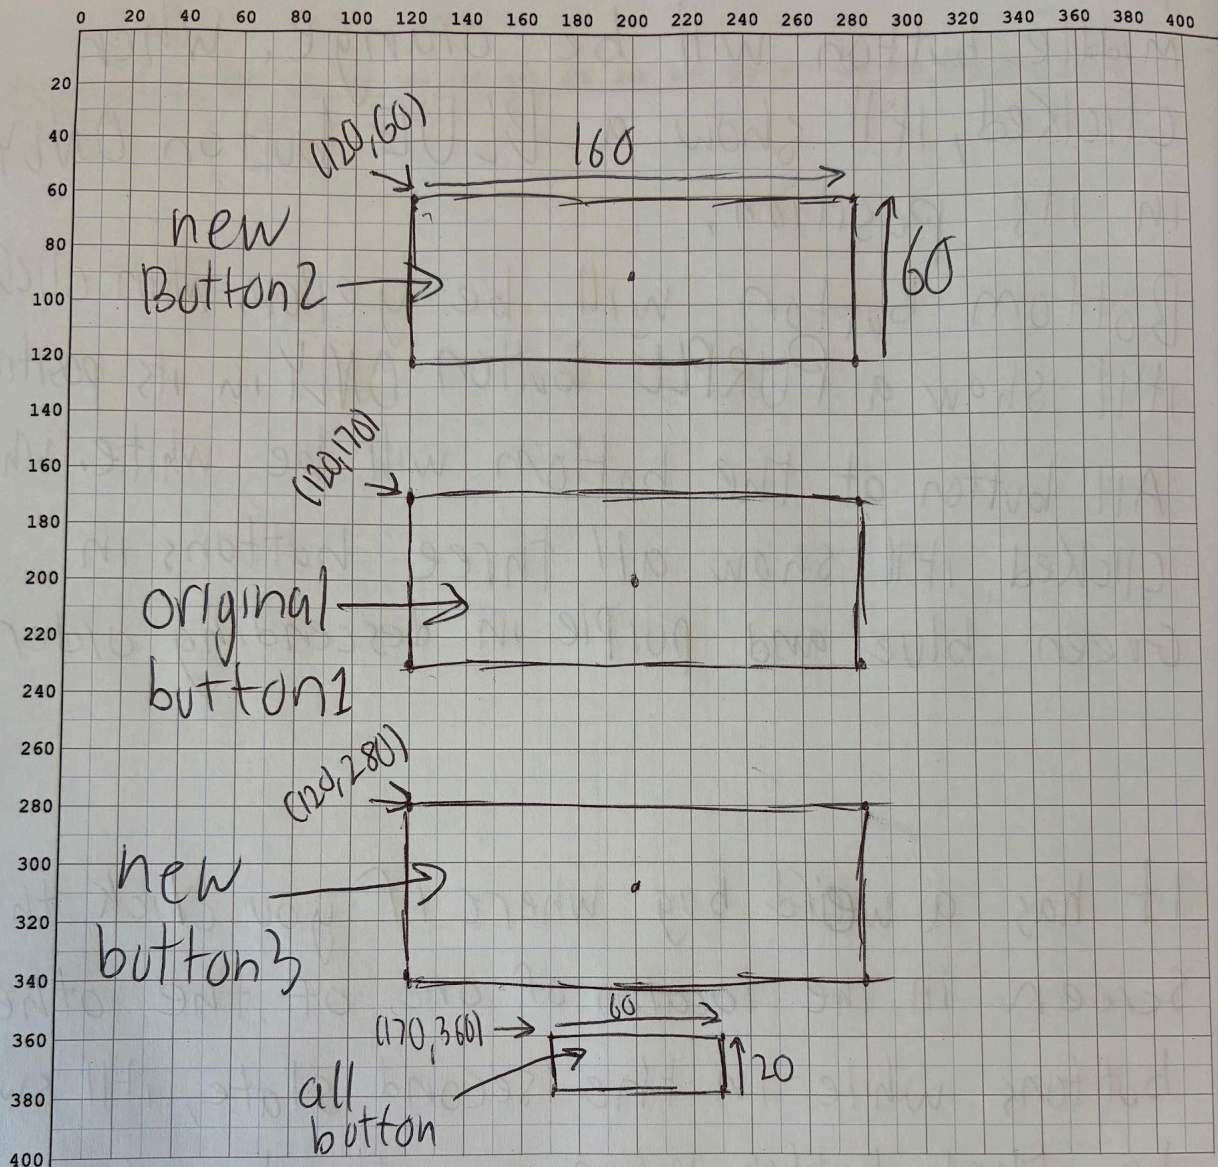

I FIGURED IT OUT!!! (with help).

It was a lot of trial and error. Sometimes it would break my whole code, sometimes it would change how or when the screen changes, but I figured it out!

I was told about a "flip flop". Basically, if the mouse boolean is true, it'll set it to false. If it's false, it'll set it to true. It's so simple I don't know how I didn't think about this. I was doing a single if statement for both which would make both switches happen at once, resulting in no change. Turning it into an if-else statement solved that problem.

I did have to change the form of mouse detection from `IsMouseButtonDown` to `IsMouseButtonPressed` because otherwise it would flicker both states for as long as the button was held down.

I gotta add some more complexity to it. More shapes.

▼ change button 2 to orange
button 2 is red and button
3 is yellow

top button will be red. when clicked, it'll show a GREEN button ONLY in its position.

middle button will be orange. when clicked, it'll show a BLUE button ONLY in its position.

Bottom button will be yellow. when clicked, it'll show a PURPLE button ONLY in its position.

All button at the bottom will be white. when clicked, it'll show all three buttons in Green blue and purple in descending order.

It has a weird bug where if you click the screen in the location of one of the other buttons while in the second state, it'll switch to that button when you try to click back. not sure how to fix that.
